Robert, we actually don't speak from the SAP. We can quote from the SAP report, however.

Here's the statement from the Executive Summary:

"Using a weight-of-evidence approach, the Issue Paper concludes that glyphosate is "not likely to be carcinogenic to humans," especially at reasonably foreseeable dose-rates. Some Panel members agreed with this characterization, while other Panel members felt that the better descriptor for glyphosate is "suggestive evidence of carcinogenic potential." Many Panelists noted that crucial data were equivocal, and that additional data on cancer morbidity and/or mortality from studies of glyphosate-exposed workers would be desirable."
